

Lecture 5: Basic Input - Output

Basic Input - Output in C++

C++ comes with libraries which helps us in performing input / output.

In C++ sequence of bytes comes handling its input and output are commonly known as stream.

- **Input stream**: Direction of flow of byte take place from input device (e.g. Keyboard) to main memory.

- **Output stream**: Direction of flow of memory take place from main memory to output device (e.g. display).

- "<<" this is called insertion operator.

- ">>" this is extraction operator.

15:12
★ check reserved keyword of C++

13:23
★ check Data type and range

short int	2	float	4
unsigned short int	2	double	8
unsigned int	4	long double	12
long int	4	long long int	8
int	4
